Work Plan for

NTPEP Evaluation of Spray Applied Non-Structural and Structural Pipe Liners for Storm Water Conveyance

AASHTO Designation: [SAL] (2016)
Work Plan for

NTPEP Evaluation of Spray Applied Non-Structural and Structural Pipe Liners for Storm Water Conveyance

AASHTO Designation: [SAL] (2016)

INTRODUCTION

The National Transportation Product Evaluation Program (NTPEP) was established to minimize the amount of duplicative testing of transportation materials performed by AASHTO member states by providing a process where manufacturers submit their products to NTPEP for laboratory and/or field testing. The results of the testing are then shared with member Departments for their use in product quality verification.

This work plan provides the NTPEP member department’s information on material specifications for non-structural cementitious and resin based spray applied liners for storm water conveyance conduits. In keeping with the NTPEP philosophy of purely testing materials, no conclusions are provided with the test results. The evaluation of the test results is left up to each member department.

1. SCOPE

1.1 This work plan covers the requirements and testing criteria for the National Transportation Product Evaluation Program (NTPEP) evaluation of non-structural and structural cementitious and resin based spray applied liners for storm water conveyance conduits. The National Transportation Product Evaluation Program (NTPEP) serves the member departments of the American Association of State Highway and Transportation Officials (AASHTO).

1.2 The results of this program may be used for product quality verification by individual member Departments. If used for quality verification, a letter of certification from the cementitious or resin based spray manufacturer indicating testing was conducted by NTPEP that supports published values may be required by member Departments.

1.3 This work plan may involve hazardous materials, operations, and equipment. It does not purport to address all safety problems associated with its use. It is the responsibility of the user of this standard practice to establish the appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. REFERENCED DOCUMENTS

2.1 Standards for resin based material:
ASTM D 624, Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers
ASTM D 638, Standard Test Method for Tensile Properties of Plastics

ASTM D 792, Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement

ASTM D 2240, Standard Test Method for Rubber Property—Durometer Hardness

ASTM D 4060, Standard Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser

ASTM D 7234, Test Method for Pull-Off Adhesion Strength of Coatings Using Portable Pull-Off Adhesion Testers

ASTM E 96, Standard Test Methods for Water Vapor Transmission of Materials

2.2 Standards for cementitious based material:

AASHTO-T-358, Standard Method of Test for Surface Resistivity Indication of Concrete’s Ability to Resist Chloride Ion Penetration

ASTM C 78, Standard Test Method for Flexural Strength of Concrete (Using Simple Beam With Center-Point Loading)

ASTM C 403, Standard Test Method for Time of Setting of Concrete Mixtures by Penetration Resistance

ASTM C 418, Standard Test Method for Abrasion Resistance of Concrete by Sandblasting

ASTM C 469, Standard Test Method for Static Modulus of Elasticity and Poisson's Ratio of Concrete in Compression

ASTM C 496, Standard Test Method for Splitting Tensile Strength of Cylindrical Concrete Specimens

ASTM C 666, Standard Test Method for Resistance of Concrete to Rapid Freezing and Thawing

ASTM C 1583, Standard Test Method Tensile Strength of Concrete Surfaces and the Bond Strength or Tensile Strength o Concrete Repair and Overlay materials by Direct Tension (Pull-Off Method)

2.3 Standards for strength testing:

AASHTO M 242, Standard Specification for Reinforced Concrete D-Load Culvert, Storm Drain, and Sewer Pipe

AASHTO T 280, Standard Method of Test for Concrete Pipe, Manhole Sections, or Tile

3. WORK PLAN SUMMARY

A Spray applied liner is a trenchless technology utilized to rehabilitate storm water conveyance conduits of many shapes and sizes. The liner may be applied manually or via a remote device depending on the span and rise of the host conduit. The material used in the spray application may be resinous, cementitious, or geopolymeric. Geopolymer materials will be treated as cementitious for the purpose of evaluation. Sufficient conduit cleaning, surface preparation, flow diversion, and repair of active infiltration leaks must be performed prior to placement of the spray applied liner.

Additional structural repairs may be necessary prior to the application of the spray applied liner to ensure structural integrity due to the mechanics of the soil/conduit interaction. Proper backfill support around the host conduit is paramount to the soil/conduit interaction, which must be addressed prior to application of a non-structural spray applied liner.

Cementitious and resin based spray manufacturers will be permitted to submit their products to be tested and evaluated on a quarterly basis (January, April, July and October). Products may be evaluated for non-structural or structural applications as declared by the manufacturer. Structural liners will include all testing required for a non-structural liner in addition to testing requirements listed in Section 10. Structural liners will require the manufacturer to select the testing methodology: Method A, Method B, or both. These products are evaluated and laboratory tested by a NTPEP contracted laboratory. Test result data is entered into the web-based NTPEP DataMine program.

4. SIGNIFICANCE AND USE

4.1 This work plan utilizes laboratory testing to evaluate material used for the spray applied liner. Different laboratory material testing is required for the resin based liner versus the cementitious liner.

This work plan is intended to determine the material, durability, application properties, and the composition properties of each liner. Acceptability of each material, based upon the data generated as a result of the testing and evaluation in this practice, is the responsibility of the user. Structural design methodologies of spray applied liners are not covered under this standard practice.

5. APPLICATION FOR PRODUCT TESTING

5.1 Submittal of Product Evaluation Form(s) and other information.

The manufacturer will submit an electronic Product Evaluation Form (ePEF) to the NTPEP Manager through DataMine (http://data.ntpep.org). For each product submitted, the manufacturer will be asked to provide product literature, Safety Data Sheets (SDS) information, declaration of testing for non-structural or structural applications, and payment. Structural testing will require declaration of the testing method according to: either 10.1 or 10.2. After review of the PEF(s) for completeness and accuracy, the NTPEP Manager will work with the lead state Coordinator to decide on the products to be tested. The decision will be based upon the number of total products submitted for testing by all the manufacturers and their rank order lists. The NTPEP Manager will then advise the manufacturer within two weeks of receipt of the PEF the products approved for testing.

Note 1 – At times, it may be necessary to limit the number of submittals from each manufacturer for an evaluation period to maintain a manageable work load. Any decision by the technical committee to limit submittals for a cycle will be based on the testing capacity of the contracted laboratory(s).

5.2 Assignment of Test Number
A test number shall be assigned to each product approved for testing. The test number shall indicate the Spray Applied Liner designation (SAL), the year of submission, the submission cycle, and a sequential sample number (SAL-Year-Cycle-Sample No.). For example: SAL-2014-02-004 would be assigned to a Spray Applied Liner submitted in 2014 for cycle 2 and was the 4th product submitted.

**Note 2** – Spray Applied Liner (SAL) numbers that are assigned to a Manufacturer’s product will not change for the life of the test. Once this report is submitted to the manufacturer for review, no changes to the product name will be allowed.

**Note 3** – Product Evaluation Form(s) Submittal Deadlines - Product Evaluation Forms (PEF) shall be submitted electronically in DataMine by the deadline set forth by the NTPEP Manager in order for testing to commence in January, April, July, and October (Testing Cycle 1, 2, 3 and 4, respectively) of the year in which evaluation is to begin. The deadline will be on the closest normal business day a minimum of three weeks prior to commencing testing.

### 6. MANUFACTURER’S DOCUMENTATION

6.1 Upon submittal to the NTPEP, the manufacturer shall supply certified documentation showing the brand name and designation; the composition or description of the Spray Applied Liner; the SDS; and the manner in which the material will be identified.

6.2 The manufacturer shall indicate when this is a re-submittal, either due to a product change as described in Section 7.2 or due to the time requirements described in Section 9.

6.3 The manufacturer shall certify that, unless NTPEP is notified as described in Section 7.1, material furnished under the submitted brand name and designation will be of the same composition and formulation as originally evaluated by NTPEP.

### 7. PRODUCT CHANGES

7.1 Product Changes

If the manufacturer changes the formulation, composition, or alters the physical properties of a product previously evaluated by NTPEP, but maintains the same reported name, the manufacturer must notify NTPEP, regardless of whether or not they elect to re-submit the product for testing. The web-based test report will then be revised to note when a previously reported product has a new formulation which has not been evaluated by NTPEP.

**Note 4** – It is recommended that users of the test data require a written certification from the manufacturer stating supplied product is identical to that most recently tested by NTPEP.

7.2 Product Changes (re-submitted)

Submitted products, previously evaluated by NTPEP and reported under the same name, but which have had formulation, composition, or concentration changes, or alterations to its physical properties, will be treated as though it were new and not previously evaluated.

### 8. SAMPLING

8.1 Furnish material samples to perform each test. Include sufficient samples to permit retesting if required.

### STRENGTH TESTING

#### 10.1 Strength Test Method A

- Perform the following structural testing on the initial submission or if there is a change in the product formulation:

10.1.1 Obtain 6 concrete pipes with a span of 48 inches at a commercially available length. Ensure the concrete pipes conform to AASHTO M 242 with specified D-load 1000lb

10.1.2 Perform three-edge bearing testing per AASHTO T 280 on all concrete pipes to determine, verify, and record the actual design strength of the conduit.

10.1.3 The spray applied vendor or their approved contractor will perform repair of the failed conduits with either a resin or cementitious spray applied liner per the following:

Concrete Pipe #1 - 0.5 inch thickness

Concrete Pipe #2 - 0.5 inch thickness

Concrete Pipe #3 - 1 inch thickness

Concrete Pipe #4 - 1 inch thickness

Concrete Pipe #5 - 1.5 inch thickness

Concrete Pipe #6 - 1.5 inch thickness
10.1.4 Perform three-edge bearing testing per AASHTO T 280 on all repaired specimens after a minimum curing time of 28 days. Determine the design strength and ultimate strength of the repaired conduits. Monitor and record the deflections and any visual signs of spray liner material failure.

10.2 Strength Test Method B- Perform the following testing on initial submission or if there is a change in the product formulation:

10.2.1 Obtain 6 round 48 inch span removable forms or forms that lack stiffness that will interfere with the test results. Ensure the minimum length of the specimen is in accordance to Section 7 of ASTM D 2412, Standard Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate testing.

10.2.2 The spray applied vendor or their approved contractor will apply the liner to the form according to the following:

Specimen #1 - 0.25 inch thickness  
Specimen #2 - 0.25 inch thickness  
Specimen #3 – 0.50 inch thickness  
Specimen #4 – 0.50 inch thickness  
Specimen #5 – 0.75 inch thickness  
Specimen #6 – 0.75 inch thickness

10.2.3 Ensure the specimen is round within a 1.5% tolerance of inside or outside diameter measured at 4 points equal distance from each other around the circumference. Perform a parallel-plate load tests on each specimen. Average the results and calculate the flexural modulus.

10.2.4 Perform parallel plate testing according to ASTM D 2412, Standard Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading. Take the test to 20% deflection based on the initial outside diameter of the pipe. If any damage as specified in Section 11 of the test method occurs prior to 20% deflection, the test may be stopped at that point. A plot as per Section 11.1.7 of the test method shall be required.

10.2.5 Calculate flexural modulus EI of the specimen using Appendix X.2 of the test method and using the outside diameter of the pipe.

11. REPORTING OF TEST DATA

11.1 Test result data will be compiled and made available to all participating states and testing companies through the AASHTO/NTPEP DataMine. This report will include data only. No judgment as to a product’s acceptability will be made in this report. End user participants will establish individual criteria for product acceptability.

11.2 Test results will be reported to the NTPEP Manager in the web-based data base – DataMine – as follows: Once the data is reported to the Manager, he will forward each manufacturer’s data for their review. Once the manufacturer completes the review and accepts the data, the NTPEP Manager will release the data to the public.

11.3 DataMine – This web-based data base can be accessed through the AASHTO-NTPEP web site link at http://data.ntpep.org.

11.4 Timeline for Spray Applied Liner Evaluation and Reporting of Data

- The host state DOT shall conduct four cycles of Laboratory testing per calendar year.
• Submittal package shall be maintained on the NTPEP webpage. Deadlines for submittal of samples are as follows (actual date will be the closest normal business date):
  o Cycle 1 – January 1
  o Cycle 2 – April 1
  o Cycle 3 – July 1
  o Cycle 4 – October 1
• 60 calendar days after Test start date – completion of laboratory testing.
• 65 calendar days after Test start date – completion of test results review and submission to the Lead State.
• 75 calendar days after Test start date – completion of test results review and submission to the Manufacturer.
• Results released to Public (pending manufacturer approval) within 100 days after sample test start date.
• Product listing shall be valid for three (3) years after the initial submission.

### 12. TEST REPORT REVIEW AND TEST RESULT APPEALS

Each NTPEP contract laboratory will submit the DataMine data to the lead state Coordinator and the NTPEP Manager within 20 business days after completion of all testing. Each manufacturer will receive access to the data for their specific products. The manufacturer will review the data and may appeal the results of the testing program in accordance with the AASHTO/NTPEP appeals procedures. An appeal must be submitted within 6 months from the date of reporting by the testing facility. Re-testing of the materials will be performed by the NTPEP contract laboratory, and only on the relevant sample and parameter being questioned. No additional sample material will be received for re-testing. The contract laboratory will provide results of the re-test within 20 business days. Prior to re-test, the manufacturer making the appeal shall submit a fee to NTPEP to cover the costs of re-testing. Should the results of the re-test uphold the appeal, the fee shall be reimbursed to the submitting manufacturer. Upon agreement between the manufacturer appealing the test results and the NTPEP Manager, either the original set or re-test set of data shall be published.

### 13. RESUBMITTAL TESTING FREQUENCY

Resubmittal of a previously tested product must be accomplished within the testing frequency outlined in Section 9. If resubmittals have not been received by the end of the testing frequency time frame, then the product will be removed from DataMine.

The manufacturer may elect to resubmit products earlier for full testing to fulfill member state’s requirements to be maintained on their qualified products list (QPL).

### 14. TESTING FEES

Testing fees are to be paid at time of application. Fees paid by the manufacturer will not be refunded once testing begins.

**Note 6** - A re-test fee for challenged results shall be paid by the manufacturer. This fee is refundable if retesting upholds the challenge. Fee is to be paid only if the original test results are found to be accurate.
